

ABSTRACT

A method and system are described for exchanging information with a process using a window display port. According to an exemplary embodiment, information related to a first process is presented in a window that is resizable within a presentation space of a monitor. A
5 second process is selected and a display port is opened in a portion of the window. Information related to the second process is presented in the display port. The display port is linked to the window within the presentation space of the monitor. The first and second processes can be associated with respective application programs.
